RFID Asset Manager

The Asset Manager solution is the most comprehensive enterprise solution for those seeking to track their assets from cradle to grave. First and foremost the application resides in the cloud so there's no additional PC hardware requirements, messy cd's, or software updates to be concerned with. Being cloud based provides easy access to your data from anywhere in the world, providing an internet connection exists. This includes today's common smart phones or tablet computers. Above and beyond the traditional asset management functionality, we also include inventory and service modules for tracking maintenance and other inventory activities. We provide clients with many views of their data, such as maps, an elegant dashboard, or traditional text based views. Furthermore our Alerts engine provides various alerts based on real time hardware, events, or date based triggers. Lastly, Asset Manager includes a report writer so anyone can create a custom report without the need of an IT person.

Dash Board View

RTLS Module

RTLS provides real time Location of your assets and/or personnel. When you combine this functionality with support for passive and active RFID technology, you get a highly advanced tracking system that literally tells you in real time where your assets are positioned on a map, tells you when each asset moves, and can even tell you the temperature in the environment.

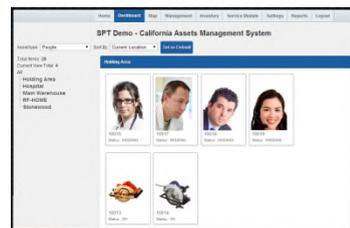

Track Assets and People in a facility
