

### Pilot Controlled Check Valves

These check valves allow flow in one direction and prevent flow in the reverse direction, until operated by pilot pressure to allow free reverse flow. The specified cracking pressure is required to open the valve to allow free flow direction.

\* Rated flow is the approximate flow rate, when there is a free flow pressure drop of maximum 3 Kgf/cm<sup>2</sup> the fluid has a specific gravity of 0.85, kinematic viscosity of 20cSt, and the cracking pressure is 0.4 Kgf/cm<sup>2</sup>.

- Sub-plates are available, specify sub-plate model from the table above. When sub-plates are used, the mounting surface should have a good machined finish.

### Instructions

- Operation of internal drain and external drain types**  
When the outlet side P1 is directly connected to the tank in reversed free flow (Fig. a), internal drain type is normally used. When the back pressure is applied to the outlet side P1 (Fig. b), be sure to use external drain type.
- Minimum pilot pressure characteristics**  
That depends on the pressure of inlet side in the reversed free flow. This value can be determined from the characteristics chart.
