

Warehouse Humidification Cold Storage

Cold Storage

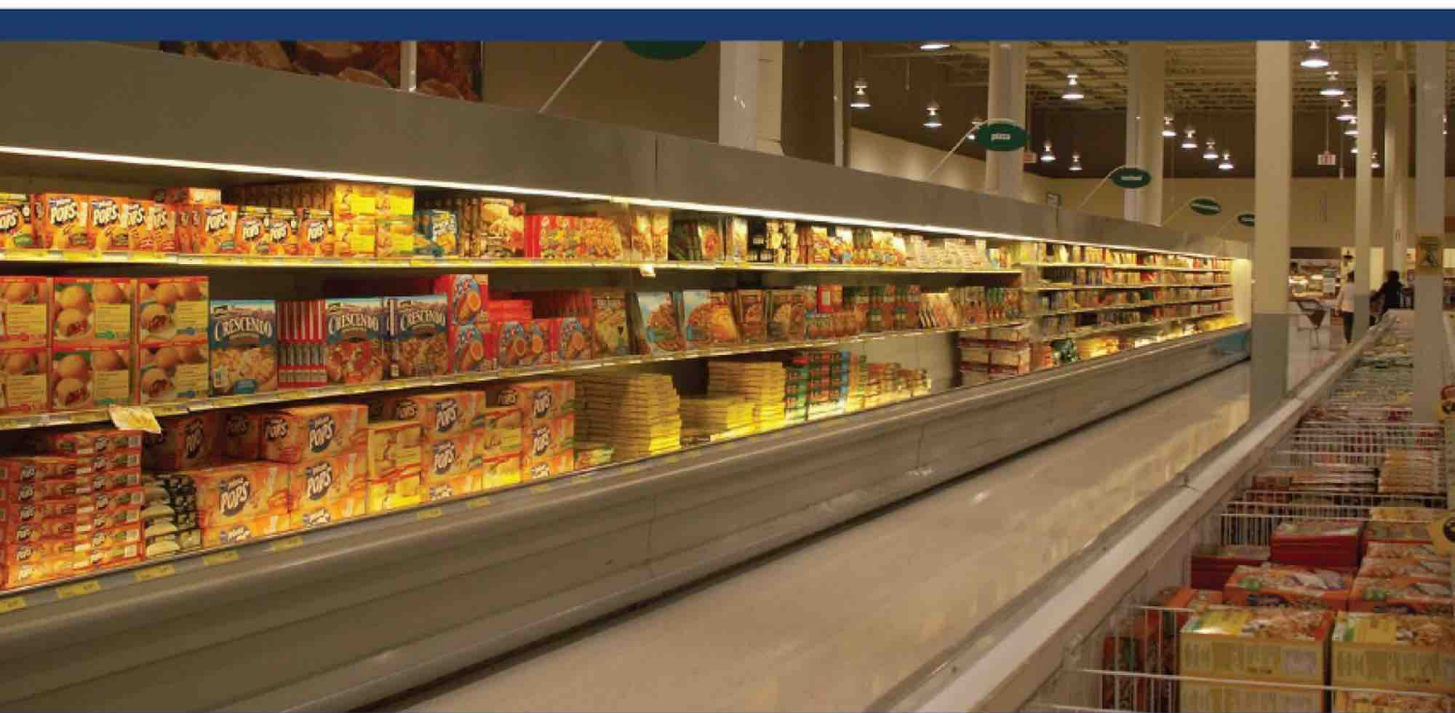

PROBLEM

In chilling rooms and cold storage treatment of the air with conditioning units depresses the humidity to unacceptable levels, causing plants, vegetables and fruits to dehydrate lose weight and deteriorate more rapidly.

SOLUTION

Our engineers can accurately calculate water requirements in individual rooms and design a high pressure fog system around those needs. A computer controller accurately monitors and corrects the humidity levels by staging the fog operation.

Easily and quickly installed by owners or the Hydromist team, this system offers a low cost, low maintenance alternative to conventional systems. Smaller, more compact systems for meat and flower storage areas are also available.
