IntelliVAN

IntelliVAN is our most complete system for tracking assets that are deployed on vehicles. Service companies that rely on having the right equipment in their vehicles know the importance of tracking this equipment. Imagine the effectiveness of a tow truck that is missing jumper cables, or an electrician without a meter, or worse yet an ambulance without a defibrillator.

This solution is designed to track assets that are on board a vehicle without having to physically account for them. The system allows you to automatically confirm that all your assets are on board and accounted for before the vehicle departs. Turn on your smart phone and see the location of all your assets in seconds, find your equipment right down to the vehicle, bin or cabinet—if it is not in your vehicle, you will know. Our auto detect feature quickly reads all the tags in the vehicle and determines what is missing, is something in your location that belongs somewhere else, and lastly—is everything ok. The application runs on any android smart phone. The easy to read display provides intuitive color coding of data. Red indicates a missing asset while green confirms the equipment is accounted for. Yellow represents known equipment that belongs in another vehicle.

In addition, IntelliVAN has fully integrated modules for passive and active RFID technology, calibration, kitting, inventory, routing and much more. It is highly scalable and fully customizable, and leverages all the latest state-of-the-art technologies such as wireless mobility and RFID.

Industry Vertical Modules

IntelliVAN has industry specific modules designed and customized for your specific industry requirement. These modules provide support for the following industries:

Emergency Response (EMS)	Field Maintenance	Landscaping
Construction	Mobile Assets	Restoration

Track Equipment in your vehicle in seconds and in real time

View mobile assets on your Android
